Radix Tree Workload Modes

Finding the Sweet Zone

Other experiments

1 Radix Tree Workload Modes

2 Finding the Sweet Zone

3 Other experiments

Full Sharing (All share 3L)

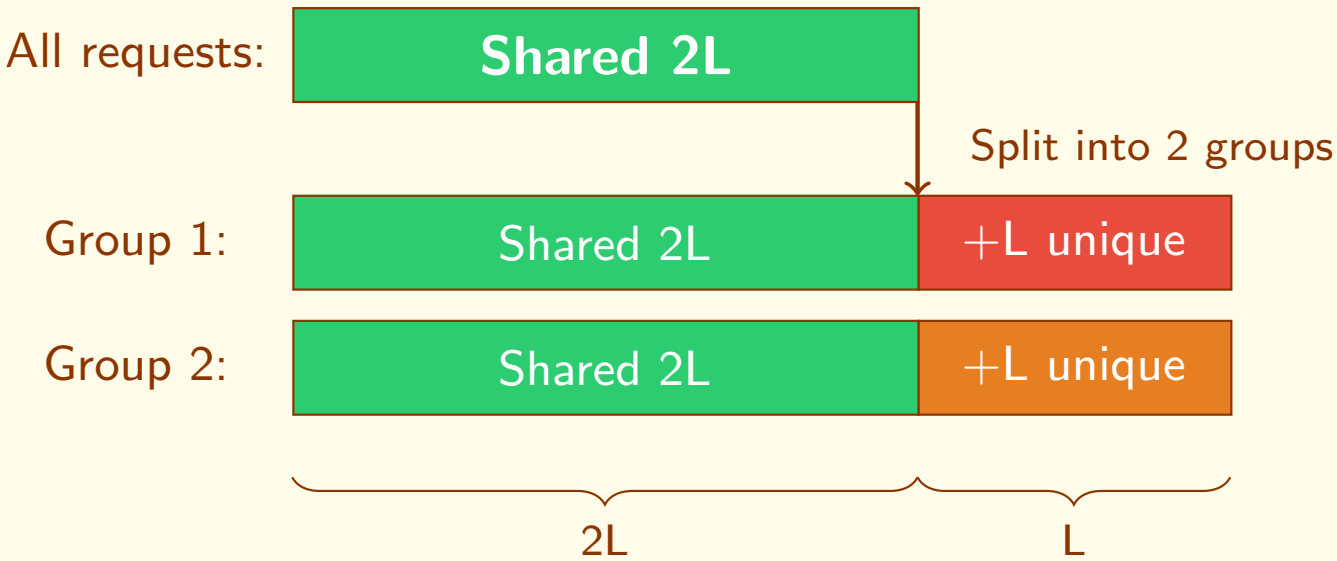

All requests: **Shared 3L**

3L tokens

Mode 2

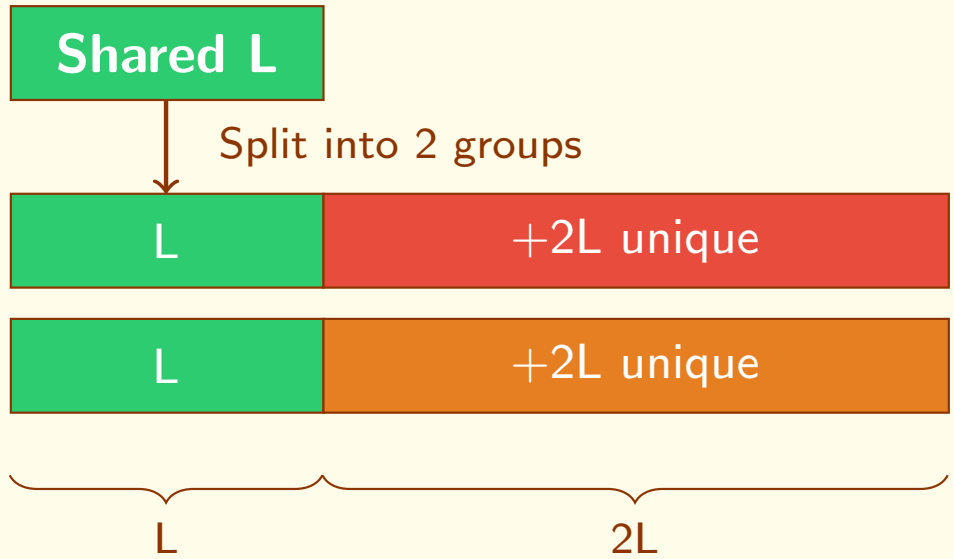

All share 2L, then 2xL

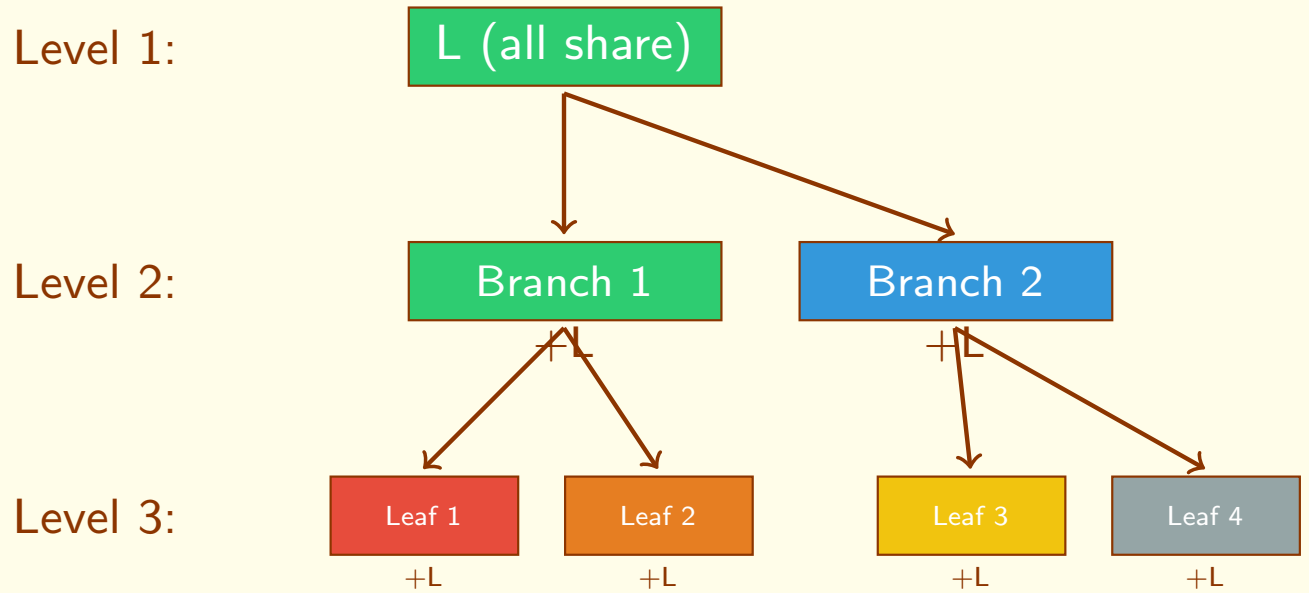

All share L, then 2x2L

All requests:

Three-Level Tree (L → 2L → 3L, 4 leaves)

Mode 5

2 separate groups with 3L each

Group 1: **Context A (3L tokens)**

Group 2: **Context B (3L tokens)**

3L tokens (completely different)

Results across varying L

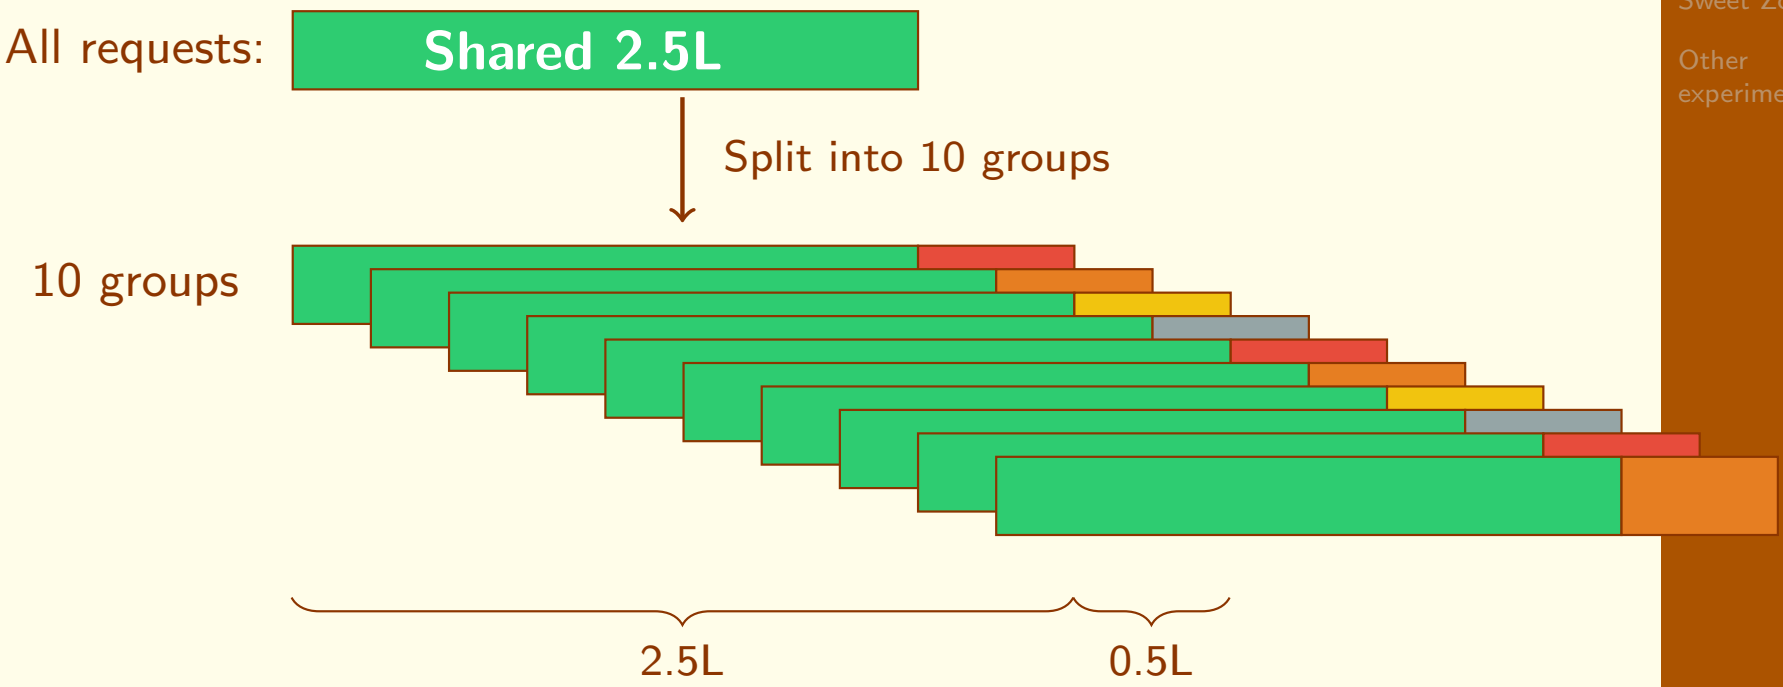

Figure: Results across varying L

Mode 6

2.5L shared + 10x0.5L

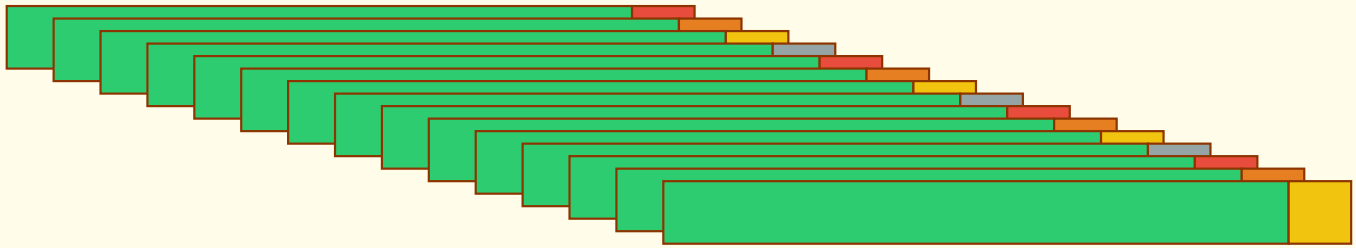

Mode 7

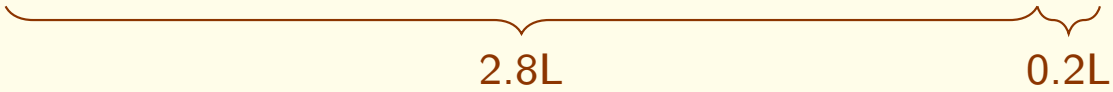

2.8L shared + 50x0.2L

All requests: **Shared 2.8L**

50 groups

...(More groups)

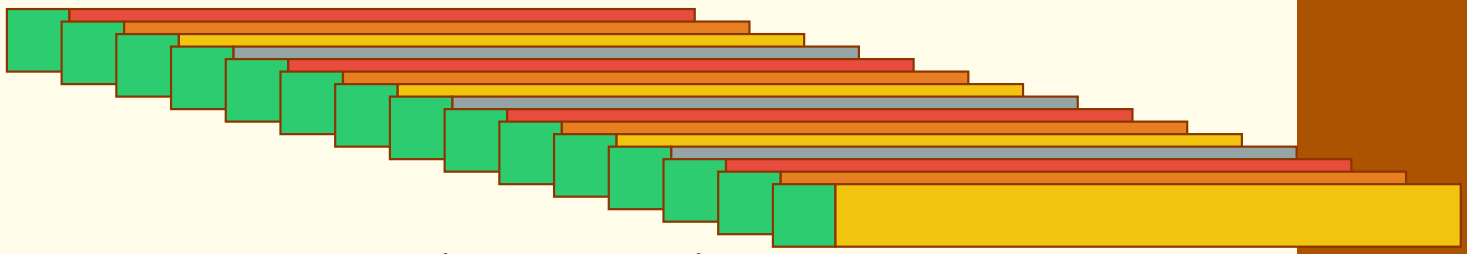

Mode 8

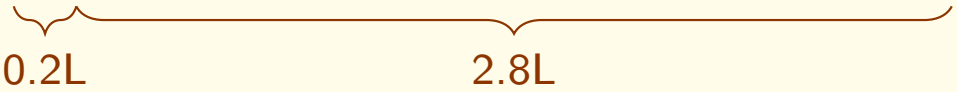

0.2L shared + 50x2.8L

All requests: 0.2L

50 groups

...(More groups)

Comparison of Throughput across different modes

Modes	**L = 1000**	**L = 2000**
Mode 1 - All share 3L	29.18	27.97
Mode 2 - All share 2L, then 2xL	19.94	14.06
Mode 3 - All share L, then 2x2L	15.40	8.89
Mode 4 - L $\rightarrow$ 2L $\rightarrow$ 3L, 4 leaves	15.41	9.88
Mode 5 - 2 separate groups with 3L each	10.18	6.62
Mode 6 - 2.5L shared + 10x0.5L	25.34	20.27
Mode 7 - 2.8L shared + 50x0.2L	28.05	23.17
Mode 8 - 0.2L shared + 50x2.8L	10.05	6.48

Table: Comparison of Throughput across different modes

How many families?

- A high request arrival rate (500 req/sec)
- Max batch size of 500
- A shared prefix of length 6500 tokens
- 100 new output tokens
- Model: Llama3.1-8B

Number of Families	vLLM Baseline (FCFS)		vLLM (User-provided Family IDs)	
	Average Batch Size	Throughput	Average Batch Size	Throughput
10	465.48	5.92	141.23	21.94
20	455.47	5.74	72.67	15.27
50	57.48	2.07	64.77	14.84
100	41.97	1.11	67.14	14.82

How many req/sec?

- 5 families
- Max batch size of 500
- A shared prefix of length 6500 tokens
- 100 new output tokens
- Model: Llama3.1-8B

req/sec	vLLM Baseline (FCFS)		vLLM (User-provided Family IDs)	
	Average Batch Size	Throughput	Average Batch Size	Throughput
1	2.6	1.04	2.02	0.95
2	5.15	2.00	4.48	1.99
5	29.60	5.09	11.11	4.40
10	395.80	4.42	23.96	8.16
20	438.85	5.25	52.79	13.32

How long should the shared prefix be?

- A high request arrival rate (500 req/sec)
- Max batch size of 500
- 5 families
- 100 new output tokens
- Model: Llama3.1-8B

Shared Prefix Length in Number of Tokens	vLLM Baseline (FCFS)		vLLM (User-provided Family IDs)	
	Average Batch Size	Throughput	Average Batch Size	Throughput
13	455.48	42.47	141.23	44.67
65	448.87	40.14	318.60	43.96
130	460.09	38.19	330.49	41.99
260	462.80	35.34	326.36	44.58
650	469.12	27.47	335.21	42.00

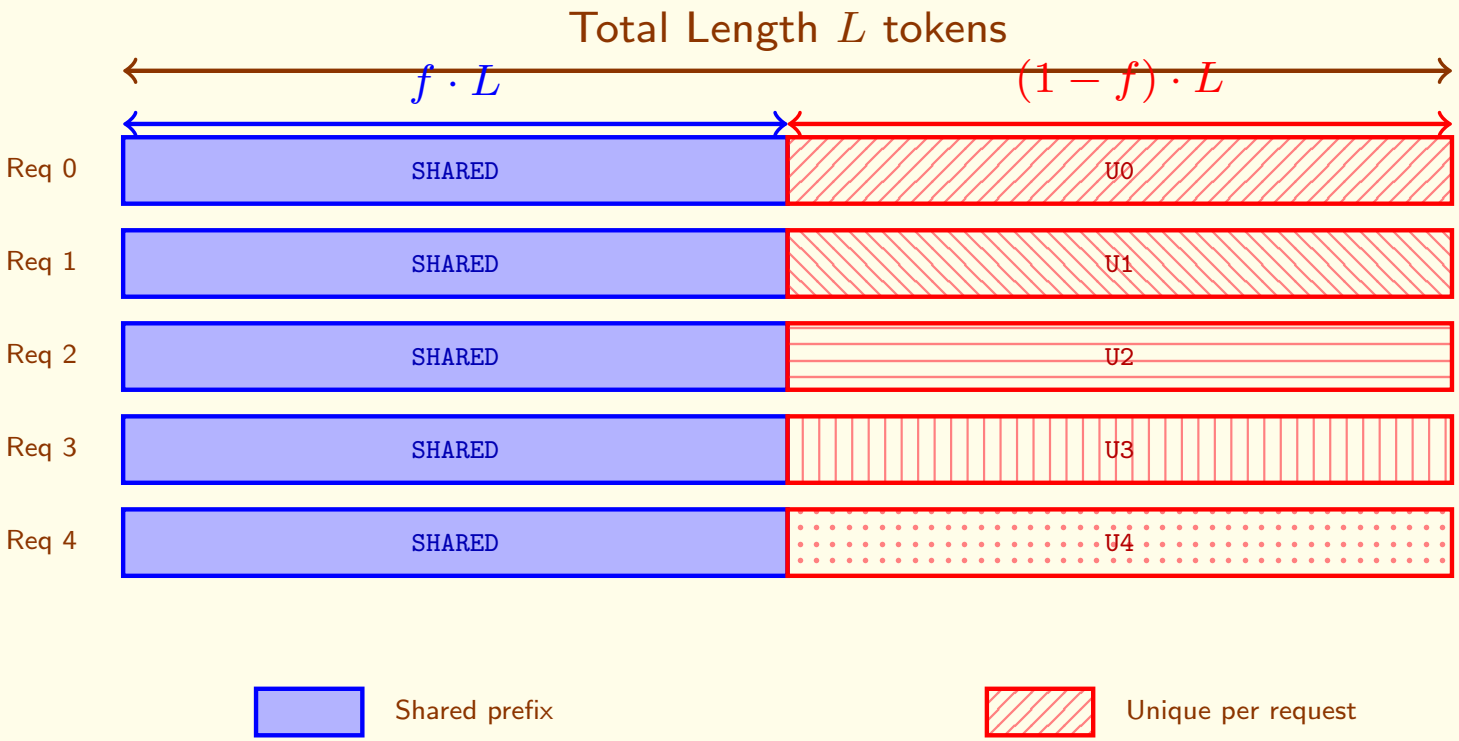

How large should the model be?

- A high request arrival rate (500 req/sec)
- Max batch size of 500
- 5 families
- 100 new output tokens
- Shared prefix length: 6500 tokens

Model Name	vLLM Baseline (FCFS)		vLLM (User-provided Family IDs)	
	Average Batch Size	Throughput	Average Batch Size	Throughput
Qwen2.5-0.5B	378.98	25.40	89.63	49.08
Llama3.1-8B	448.87	4.34	151.21	30.84
LongChat-13B	5.28	0.61	215.70	22.01

Varying the amount of sharing

Figure: Mean SM Occupancy across fraction of requests from A (L = 2000 tokens)

Two Family Mixture - Mean Tensor Core Utilization

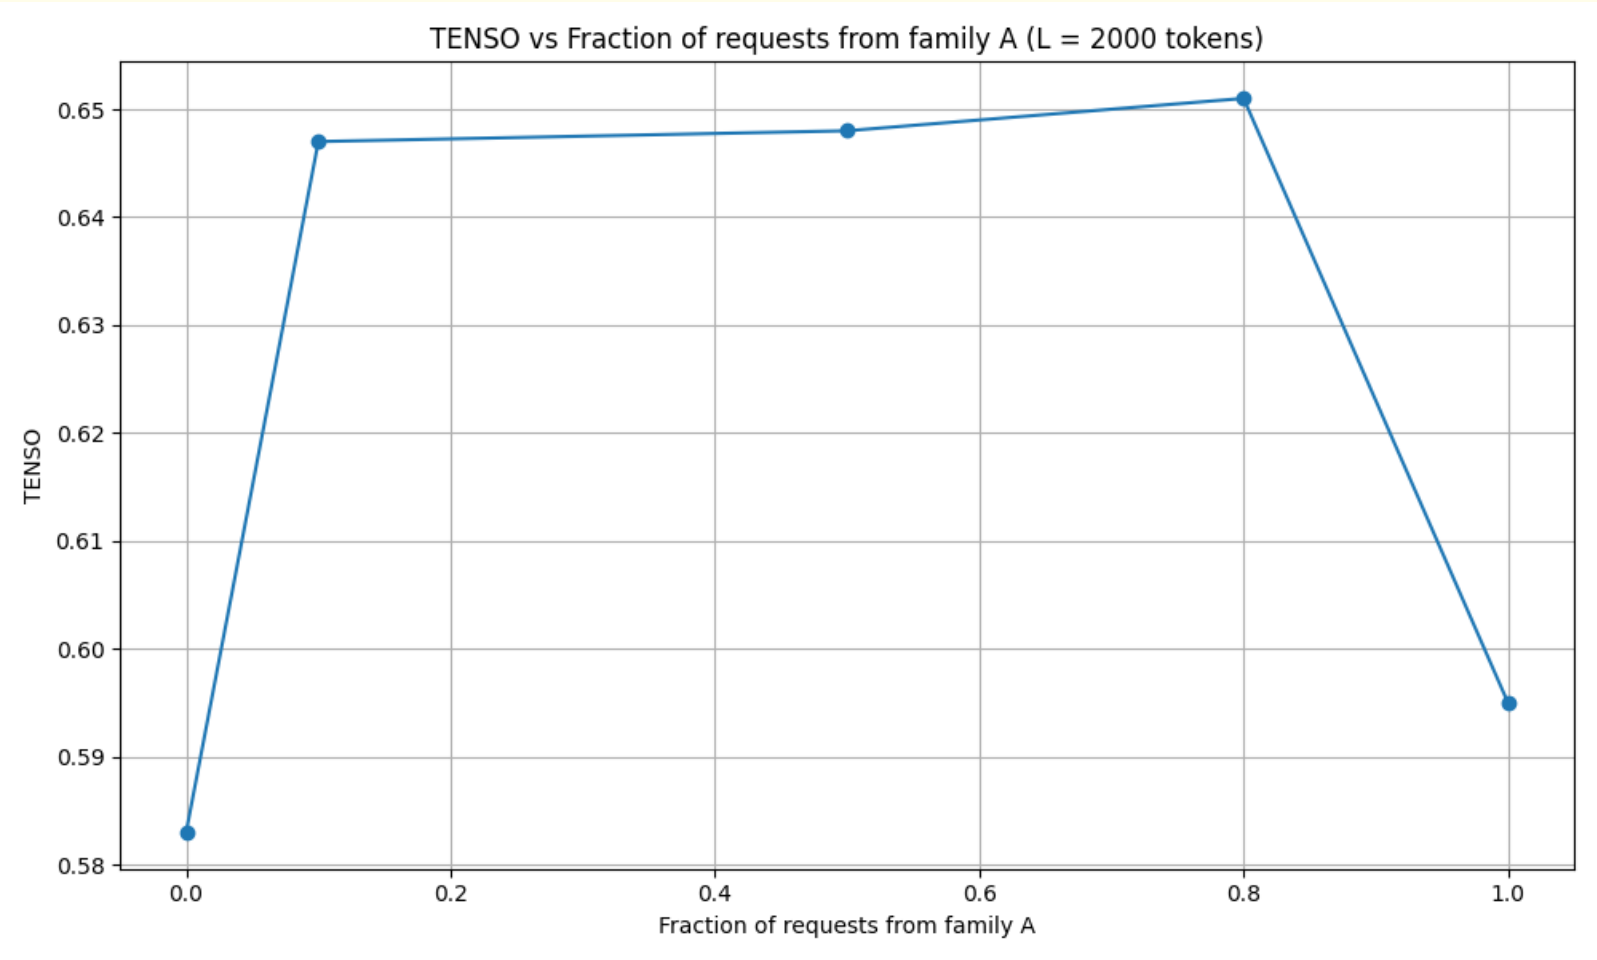

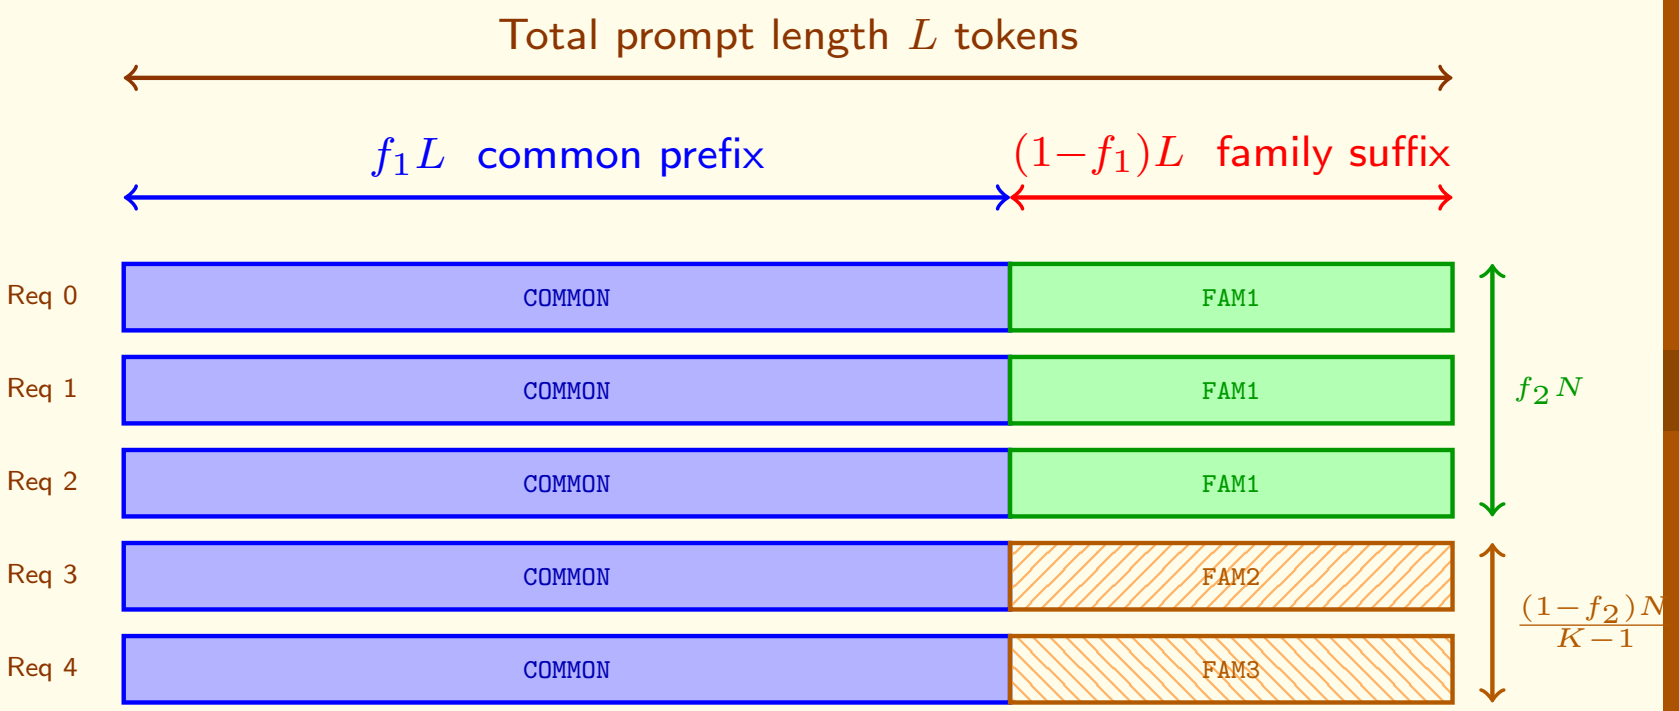

Figure: Mean Tensor Core Utilization across fraction of requests from A (L = 2000 tokens)

Tiered Prefix Sharing

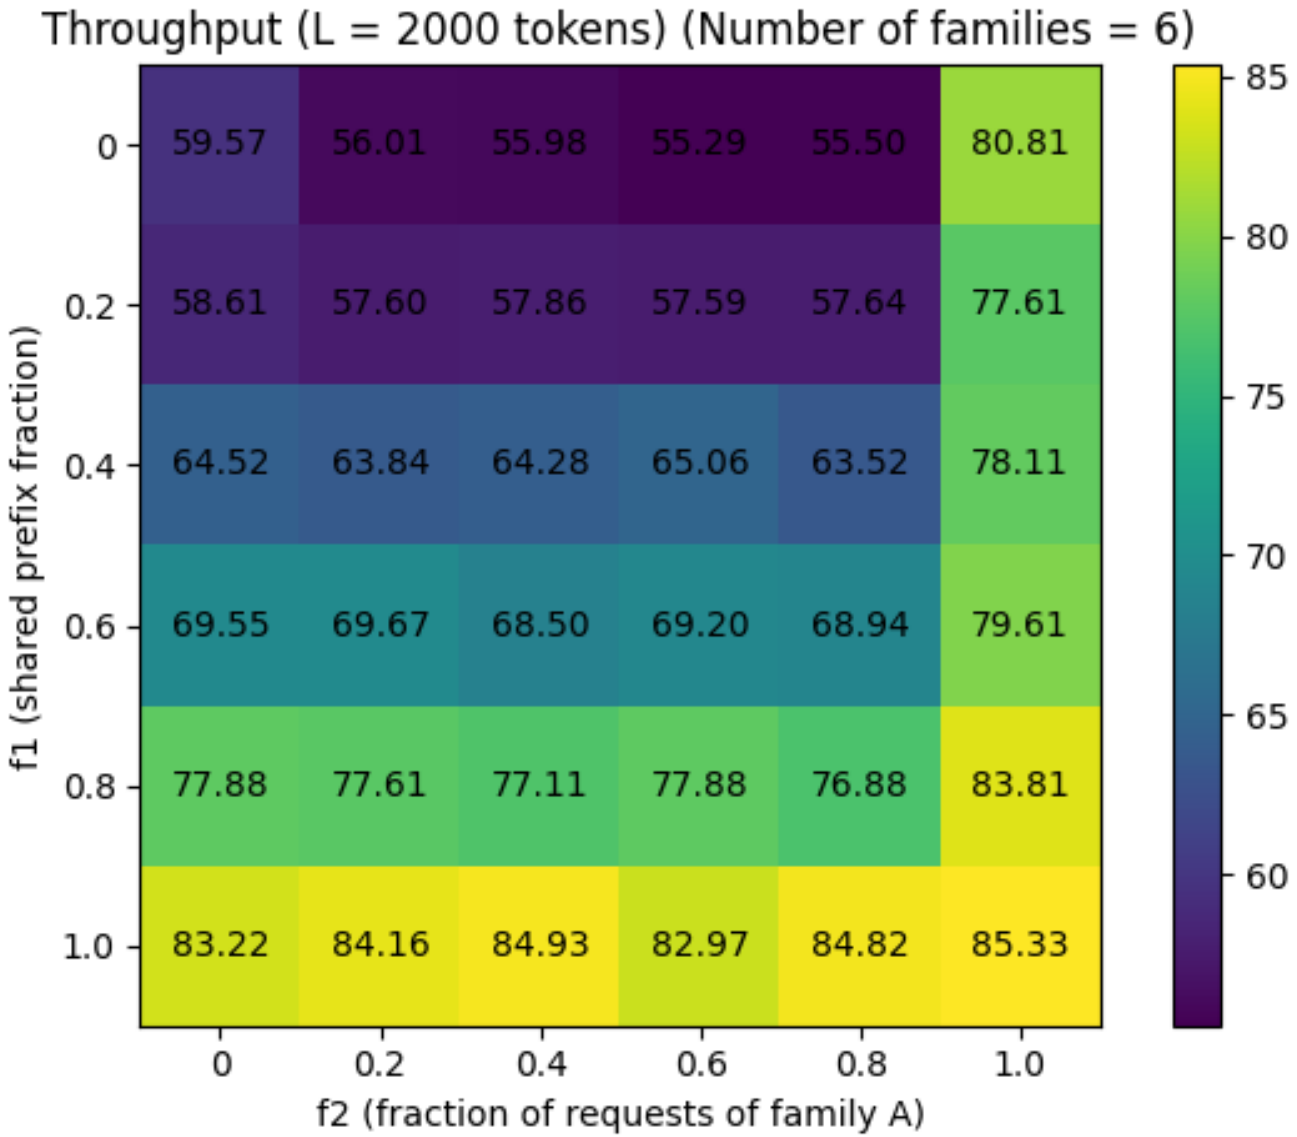

Common prefix — shared by *all* N requests ($f_1 L$ tokens)

Family-1 suffix — shared by $f_2 N$ requests (dominant family)

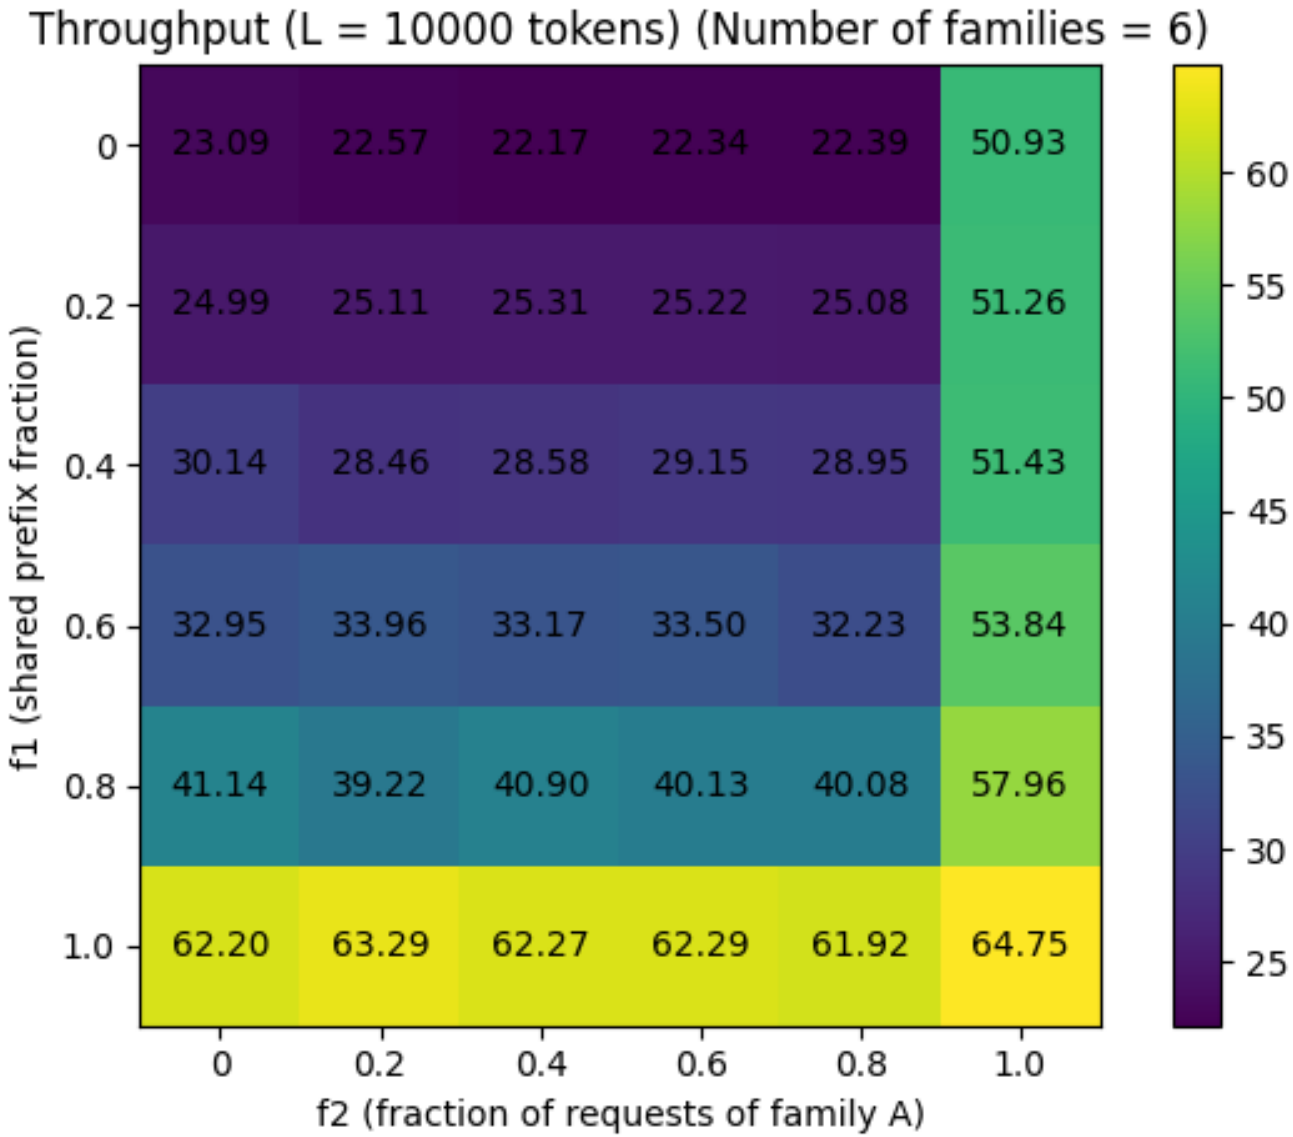

Unique family suffix — $K-1$ minority families, $\frac{(1-f_2)N}{K-1}$ reqs each
